

Hand held devices have safety issues. Our product has freed the operator from those safety issues. The concerns over the safety of the other background blasters has led VARMITgetter LLC to design a device that has these advantages:

- Operator DOES NOT hold onto the applicator when producing the blast and can be 25 ft. or more away from the blast site.
- Other hand held units cause operators to back off (it scares them), resulting in an ineffective application plus some operators become fatigued by the constant concussion from the blasts.
- It is smaller and better balanced, making it more portable to move from burrow to burrow and easier to use on gophers, voles moles, etc. and able to do larger holes such as prairie dogs, ground squirrels, etc.
- A calibrated mixture of oxygen and propane, the gas is dispersed into the tunnel system. It is remote detonated to ensure the operator does not get fragmented. The tunnel system and anything in the tunnel system is gone for pennies.
- VARMITgetter can be backfilled to keep concussion in the tunnel and noise level down.
- Single dispersion hose provides better gas mix, giving more efficient, effective and consistent blasts.
- An improved design to protect sensitive parts also gives ready accessibility for in the field repairs.

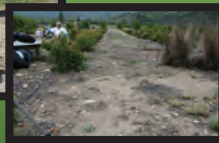

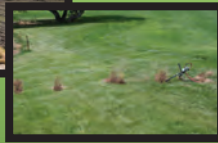

Now all VARMITgetter units come standard with a 24" stainless steel memory flex attachment.

**VARMITgetter Component System (The Burrow Blaster)**

We have found the component system is better for larger animals such as groundhog, prairie dogs, rabbits even badgers.

**VARMITgetter tm The Original Remote Control Burrowing Pest Control Device**

Underground blasters are not a new technology; they have been around for some time and have evolved over the last ten years, becoming more efficient and now safer.

Concerns over the safety of the other underground blasters have led the VARMITgetter folks to design a device that features many advantages not offered by other devices.

**VARMITgetter's remote control has taken gas technology to a new and safer level in place of inferior hand held units that can cause operator injury due to fragmentation and flashback from ignition source.**

**FRANCHISES**

VARMITgetter has developed a consistent mixing technique that allows the gas to be dispersed 3 to 4 times faster than other hand held devices using torch handles.

VARMITgetter can be backfilled to keep concussion in the tunnel and noise level down.

Hundreds of golf courses, parks, school districts, recreation districts, use our device. They favor VARMITgetter because no poisons are applied to the ground.

Would you like to be in the middle of a big blast? Hand held devices are dangerous, you could get hit with flying debris. Hand held operators are constantly being fragmented.

Hand held devices have safety issues; our product frees the operator of those issues.

In sensitive areas such as sidewalks, patios, underground irrigation, there is a suffocation method without ignition.

A tunnel system of 100 ft. in length cost pennies to destroy. Tunnel systems are completely destroyed. If you poison, chances are the rodent could come topside for a secondary kill-like pets, and the tunnel system is still there. Rodents are territorial, in 2-8 weeks there will be another rodent in the system.

No damage to trees or sod. Believe it or not, farmers have reported aeration of soil.

Hand held devices have safety concerns. Our product has freed the operator of these concerns. The VARMITgetter operator DOES NOT hold the applicator when producing the blast, and can be up to 25 ft. away. Other hand held units cause operators to back off (they're afraid of it), resulting in an ineffective application. Also, the operator becomes fatigued by the constant concussion from the blasts.

Safety measures, in the event that the device has been damaged or misused, include check valves, flashback arrestors and pressure relief plugs.

The VARMITgetter comes with applicator, 25 ft. of single hose/ignition cord, control box, 12 ft. of twin gas hoses, oxygen and propane regulators, two 9 volt batteries, VG shovel, safety glasses, protective ear muffs and easy to follow instructions and operator's manual.
